# CHAPTER 1

## INTRODUCTION

### 1.1 PROJECT OVERVIEW:

Today, technology has penetrated every part of human life. But the contribution of technology to the field of agriculture is considerably low when compared to the other sectors, which saw an incremental growth over the last decade.

The domain of Agriculture contributes the most to the Indian economy and about 1/3rd of India's population is directly dependent on agriculture for their source of income. Considering this, even a small improvement in this sector will make a huge impact on the Indian economy and on the life of farmers. This helps farmers and consumers equally as it is the consumers in the end, who get to enjoy low priced goods without deterioration in quality.

To achieve this, we have to overcome the hurdles faced by farmers, which mostly revolve around crop disease, improper maintenance of crops, lack of details about the quality of soil and intervention of animals and birds. To overcome this, in this project we propose 'An intelligent crop protection system', the main objective of which is to improve the yield and increase the profit for farmers. An intelligent crop protection system uses data from moisture, motion, temperature, humidity sensors and updates the data in real time in IBM cross platform IOT cloud interface. The motors and the sprinkling system are activated based on the data from the sensors. Also when the motion sensor detects motion, the farmer is notified with that through the mobile application. This helps the farmers in protecting the crop from the animals and birds which destroy the crop. And also ease up the maintenance process. The historical data from sensors are stored in cloud, so this can also be used for soil evaluation and this also helps to plan, which type of crops are to be planted in the upcoming seasons so that the yield is high.

**1.2 PURPOSE:**

A vast majority of the people are invariably affected by the production of crops. Farmers, for example, rely on them for their survival. The consumers, on the other hand, depend on the crops as it provides them with a multitude of utilities. It therefore, becomes essential to protect and maintain these crops. The project aims at improving the farmers' situation by preventing them from incurring losses due to the damage of crops.

## CHAPTER 2

### LITERATURE SURVEY

#### 2.1 EXISTING PROBLEM:

In real time, it was learnt that the size of the animal is found out by using several PIR sensors. PIR sensors can be used to determine the height of the animals instead of using a camera for image processing. This reduces the processing time and power. The crop protection is majorly dependent on the moisture content of the soil, the temperature and humidity of the surrounding environment. Additionally, tracking of the damaged crops location is done and the camera is activated only at that instant in order to capture the image.

From the literature survey performed it is evident that image based animal intrusion identification is not necessary in all situations because it requires high computation power, and the cost of the installation will be high when compared to that of a typical sensor based intrusion identification.

### **2.3 PROBLEM STATEMENT DEDINITION:**

- Problem of getting damage of crops by animals remains a problem when a better smart crop Protection device is not built.
- Preventing damage from animals is quiet difficult.
- The movement in the crop production is usually determined by the millions of farmers who produce crops production.
- The role of Investing for building Electric Fence and Scarecrow can be avoided.

## CHAPTER 3

### IDEATION & PROPOSED SOLUTION

#### 3.1 EMPATHY MAP CANVAS:

An empathy map is a collaborative visualization used to express clearly what one knows about a particular type of user. It externalizes knowledge about users in order to create a shared understanding of user needs, and aid in decision making. Empathy maps are split into 4 quadrants (Says, Thinks, Does, and Feels), with the user in the middle. Empathy maps provide a glance into who a user is as a whole.

#### 3.2 IDEATION & BRAINSTORMING:

Ideation is often closely related to the practice of brainstorming, a specific technique that is utilized to generate new ideas. Brainstorming is usually conducted by getting a group of people together to come up with either general new ideas or ideas for solving a specific problem or dealing with a specific situation. A principal difference between ideation and brainstorming is that ideation is commonly more thought of as being an individual pursuit, while brainstorming is almost always a

group activity. Both brainstorming and ideation are processes invented to create new valuable ideas, perspectives, concepts and insights, and both are methods for envisioning new frameworks and systemic problem solving.

### 3.3 PROPOSED SOLUTION:

S.NO.	Parameter	Description
1.	Problem Statement. (Problem to be solved)	<ul style="list-style-type: none"> <li>• Crops are not irrigated properly due to insufficient labour forces.</li> <li>• Improper maintenance of crops against various environmental factors such as temperature climate, topography and soil quantity which results in crop destruction.</li> <li>• Requires protecting crops from wild animals attacks birds and pests.</li> </ul>
2.	Idea /Solution Description.	<ul style="list-style-type: none"> <li>• Moisture sensor is interfaced with Arduino Microcontroller to measure the moisture level in soil and relay is used to turn ON &amp; OFF the motor pump for managing the excess water level. It will be updated to authorities through IOT.</li> <li>• Temperature sensor connected to</li> </ul>

		<p>microcontroller is used to monitor the temperature in the field.</p> <ul style="list-style-type: none"> <li>Image processing techniques with IOT is followed for crop protection against animal attack.</li> </ul>
<b>3.</b>	Novelty / Uniqueness.	<ul style="list-style-type: none"> <li>Automatic crop maintenance and protection using embedded and IOT Technology.</li> </ul>
<b>4.</b>	Social Impact / Customer satisfaction.	<ul style="list-style-type: none"> <li>This proposed system provides many facilities which helps the farmers to maintain the crop field without much loss.</li> </ul>
<b>5.</b>	Business Model (Revenue Model).	<ul style="list-style-type: none"> <li>This prototype can be developed as product with minimum cost with high performance.</li> </ul>
<b>6.</b>	Scalability of the solution	<ul style="list-style-type: none"> <li>This can be developed to a scalable product by using solution sensors and transmitting the data through Wireless Sensor Network and Analysing the data in cloud and operation is performed using robots.</li> </ul>

### 3.4 PROBLEM SOLUTION FIT:

Problem-Solution Fit canvas		IOT based Smart Crop Protection for Agriculture		Version 1.0	
1. CUSTOMER SEGMENT(S) <b>CS</b>	Our customers are farmers who are affected by damage of crops due to various reasons like insect attacks, animal invasion, Excess water flow, etc.	6. CUSTOMER LIMITATIONS <b>CL</b>	Customer must have minimum knowledge about using the technology.	5. AVAILABLE SOLUTIONS <b>AS</b>	<ul style="list-style-type: none"> <li>Complete control and elimination of yield-threatening weeds</li> <li>Protection from diseases for healthier farm output</li> <li>Protection from insects for high yields and quality</li> </ul>
2. PROBLEMS / PAINS <b>PR</b>	Major problems farmers face is crops being damaged by insects, animals, water and various climatic changes.	9. PROBLEM ROOT / CAUSE <b>RC</b>	<ul style="list-style-type: none"> <li>Sense the animals and insects in the crop field.</li> <li>Sense the water required for the crop.</li> <li>Sense the required climate for the crop.</li> </ul>	7. BEHAVIOR <b>BE</b>	Crop protector informs customer about the crop from being damaged by insect, animal, excess water flow, climatic changes, etc.
3. TRIGGERS TO ACT <b>TR</b>	This triggers to protect the crops from insects, animals, excess water, climatic changes, unwanted plant growth etc.	10. YOUR SOLUTION <b>SL</b>	The aim of the proposed work is to develop an IoT device for smart crop field monitoring system and automated irrigation system using the wireless sensor networks (WSN). To create an IoT device for monitoring the crop field using sensors (soil moisture, temperature, Humidity, etc.). To automate the irrigation by comparing the level of soil moisture with the threshold value.	8. CHANNELS of BEHAVIOR <b>CH</b>	ONLINE Notifies the customer about the crops being damaged  OFFLINE Senses the crops
4. EMOTIONS <b>EM</b>	Before there is no technology to protect the crop from insects, animals, excess water, climatic changes, unwanted plant growth, etc. so many farmers committed suicides.				

## CHAPTER 4

### REQUIREMENT ANALYSIS

Requirements analysis is very critical process that enables the success of a system or software project to be assessed. Requirements are generally split into two types: Functional and Non-functional requirements.

#### 4.1 FUNCTIONAL REQUIREMENTS:

These are the requirements that the end user specifically demands as basic facilities that the system should offer. All these functionalities need to be necessarily incorporated into the system as a part of the contract. These are represented or stated in the form of input to be given to the system, the operation performed and the output expected. They are basically the requirements stated by the user which one can see directly in the final product, unlike the non-functional requirements.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form Registration through Gmail
FR-2	User Confirmation	Confirmation via Email
FR-3	Interfacing with hardware	Interface the sensors with the software application so as to alert the farmers in case any harm for crops
FR-4	Database Connection	Databases are retrieved from IBM Cloud ant
FR-5	Mobile Application	Alarm and motors can be accessed from the mobile app

## 4.2 NON-FUNCTIONAL REQUIREMENTS:

These are basically the quality constraints that the system must satisfy according to the project contract. The priority or extent to which these factors are implemented varies from one project to other. They are also called non-behavioral requirements. They basically deal with issues like Portability, Security, Maintainability, Reliability, Scalability, Performance, Reusability, Flexibility.

FR No.	Non-Functional Requirement	Description
NFR-1	<b>Usability</b>	<ul style="list-style-type: none"> <li>The smart crop protection alerts the farmers in case of any obstacles and helps in protecting the crops</li> </ul>
NFR-2	<b>Security</b>	<ul style="list-style-type: none"> <li>Smart Agriculture can improve the farming practices and maintain sustainable production of crops especially by preventing the animals into the agricultural lands through IoT enabled devices.</li> </ul>
NFR-3	<b>Reliability</b>	<ul style="list-style-type: none"> <li>With a proper power supply, SD card and programming the processor should be able to run 24/7 for years. The SD card and power supply will likely wear out faster than the Pi. The possible reasons behind Raspberry Pi failure can be power breakdowns, SD card failures, and ineligible environments.</li> </ul>
NFR-4	<b>Performance</b>	<ul style="list-style-type: none"> <li>Usage of an SD card module that helps to store a specified sound to scare the animals.</li> </ul>

		<ul style="list-style-type: none"> <li>• Crop damage due to animal attack can be sensed. Network and Design Evaluation</li> </ul>
NFR-5	<b>Availability</b>	<ul style="list-style-type: none"> <li>• Agriculture for different variety of crops is based on the monsoon changes, indoor and outdoor climatic temperatures, availability of rainfall and irrigation methods.</li> </ul>
NFR-6	<b>Scalability</b>	<ul style="list-style-type: none"> <li>• The product shall be made available to everyone especially in remote areas for better efficiency of crop yield with the better safety of crops as well as the farmers.</li> </ul>

## CHAPTER 5

### PROJECT DESIGN

#### 5.1 DATA FLOW DIAGRAMS:

A data flow diagram (DFD) maps out the flow of information for any process or system. It uses defined symbols like rectangles, circles and arrows, plus short text labels, to show data inputs, outputs, storage points and the routes between each destination. Data flowcharts can range from simple, even hand-drawn process overviews, to in-depth, multi-level DFDs that dig progressively deeper into how the data is handled. They can be used to analyze an existing system or model a new one. Like all the best diagrams and charts, a DFD can often visually “say” things that would be hard to explain in words, and they work for both technical and nontechnical audiences, from developer to CEO. That’s why DFDs remain so popular after all these years. While they work well for data flow software and systems, they are less applicable nowadays to visualizing interactive, real-time or database-oriented software or systems.

**Fig 5.1 Data Flow**

#### 5.2 SOLUTION & TECHNICAL ARCHITECTURE:

##### **Solution Architecture:**

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

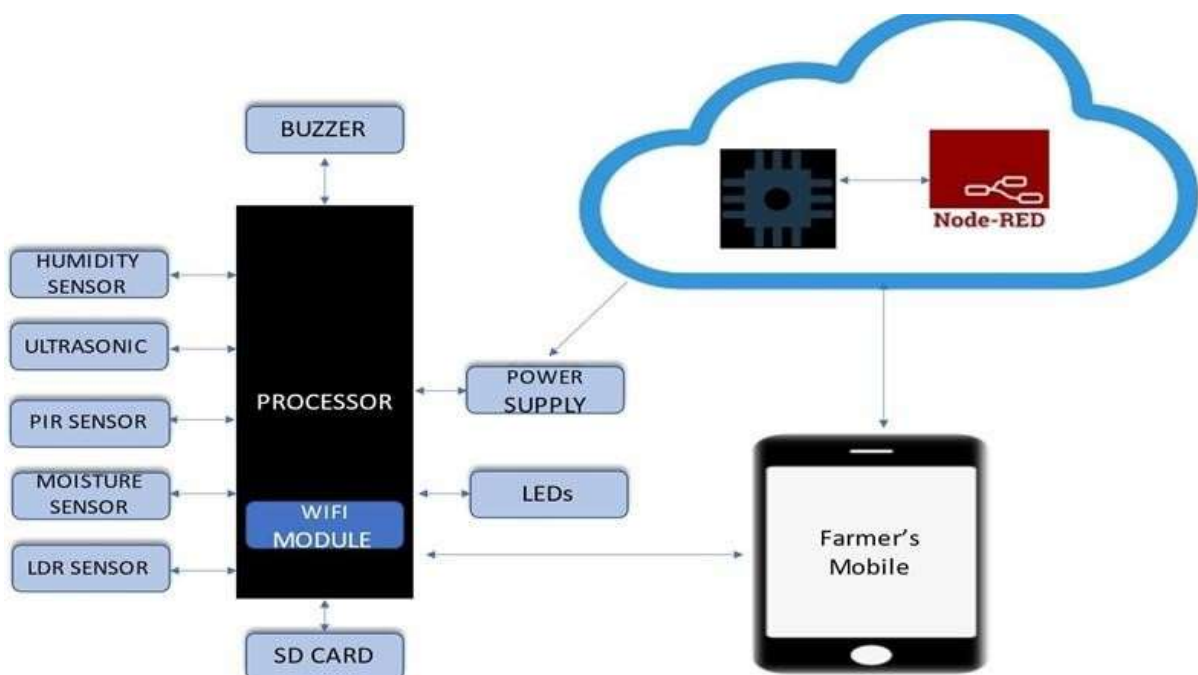

- Find the best tech solution to solve existing business problems.

- Describe the structure, characteristics, behaviour, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

### Technical Architecture:

### 5.3 USER STORIES:

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer (Farmer)	Maintaining Fields	USN-1	As a user, I can monitor the growth of crops and protect the crops against animals	I can maintain the fields with less labor	High	Sprint-1
	Analyzing Problems	USN-2	As a user, I collect the required information about the problems on agriculture fields	I can ask my field owner directly.	Low	Sprint-2
		USN-3	As a user, I can monitor the moisture level in soil and solve the problems by using Smart IOT System	I can take remedial action immediately	High	Sprint-1
Project Designers	Identifying the problem and	USN-4	As a user, I can sense the water level	I can perform this	Medium	Sprint-1

	Provide solutions		and flame in the field using sensor and monitor using IOT	actions via IoT.		
		USN-5	As a user, I can make services for Irrigation, pesticides, Fertilization, and Soil preparation	I can solve this problem using IOT	High	Sprint-1
			As a user, I can monitor the field against animal attacks using a camera interface module and appropriate actions can be taken	I can monitor the field continuously.	Medium	Sprint-2
Customer (Field Maintainer)	Problem solutions	USN-6	As a user, areas can be monitored from a remote place	Checking Process	Medium	Sprint-3

	Application	USN-7	As a user, I can respond to the problems in the fields immediately	Continuous monitoring and remedial actions.	Medium	Sprint-3
	Final Process	USN-8	This proposed smart IOT-based crop protection device is found to be cost effective and efficient	I can take necessary action if required.	Medium	Sprint-4

## CHAPTER 6

### PROJECT PLANNING & SCHEDULING

#### 6.1 SPRINT PLANNING & ESTIMATION:

Sprint planning is an event in scrum that kicks off the sprint. The purpose of sprint planning is to define what can be delivered in the sprint and how that work will be achieved. Sprint planning is done in collaboration with the whole scrum team.

The sprint is a set period of time where all the work is done. However, before leap into action it is necessary to set up the sprint. It need to decide on how long the time box is going to be, the sprint goal, and where it is going to start. The sprint planning session kicks off the sprint by setting the agenda and focus. If done correctly, it also creates an environment where the team is motivated, challenged, and can be successful.

<b>S.NO</b>	<b>Activity Title</b>	<b>Activity Description</b>	<b>Duration</b>
1	Understanding the project requirement	Assign the team members & create the repository in GitHub. Assign the task to each members and teach how to use and open access the GitHub and IBM Career Education.	1 Week
2	Starting of Project	Advice student to attend classes of IBM portals create and develop an rough diagram based on the project description and gather information of IOT and IBM project.	1 Week
3	Attend Classes	Team members & team lead must watch and learn from classes provided by IBM and Nalaya Thiran and must gain access of MIT License for their project.	1 Week
4	Budget and scope of project	Budget & analyse the use of IOT in the project and discuss with the team for budget prediction to predict the favorability of the customer to buy the product for efficient use of the product among the environment.	1 Week

**6.2 SPRINT DELIVERY SCHEDULE:**

<b>Sprint</b>	<b>Functional Requirement (Epic)</b>	<b>User Story Number</b>	<b>UserStory/Task</b>	<b>Story Points (40)</b>	<b>Priority (Low to High)</b>	<b>TEAM MEMBERS</b>
Sprint-1	Registration	USN-1	As a user, I can register for the required dataset by entering my email, password, and confirming my password.	3	high	Monisha
Sprint-1		USN-2	As a user, I will receive confirmation email and the SMS once I have registered for the application	2	high	Monisha
Sprint-2	Cloud services	USN-3	As a user, I can register for the application through Facebook or any social media	1	low	Devi
Sprint-4		USN-4	As a user, I can register for the application through Gmail/web service	2	medium	Sowmiya
Sprint-3	Login	USN-5	As a user, I can log into the	4	high	Bhavatharani

			application network by entering email & password			
Sprint-2	Preprocessing	USN-6	As a farmer, the user must be able to find the system easy to access so pre-processes and other task must be perfect.	3	high	Sowmiya
Sprint-1	Preprocessing	USN-7	To collect various sources of animal threats and keep developing a dataset.	3	medium	Monisha
Sprint-4	Collecting Dataset	USN-8	To integrate the available dataset and keep improving the accuracy of finding animals	2	high	Devi
Sprint-3	Integrating	USN-9	To find and use appropriate compiler to run and test the data so that we can implement our program	1	low	Bhavatharani

Sprint-2		USN-10	Request P.S.V College Of Engineering And Technology to deploy the project in our campus and test	1	low	Sowmiya
Sprint-1		USN-11	As programmer, we need to train our data perfectly so that the program runs smoothly	3	high	Monisha
Sprint-3		USN-12	Train the data using out available services and IBM dataset from server and improve that	2	medium	Bhavatharani
Sprint-4	Coding	USN-13	To modify the code according to our program and improve the efficiency of that code	4	high	Devi
Sprint-2		USN-13	To improve performance	1	low	Bhavatharani
Sprint-2	Record	USN-5	To record the data and plot the graph to show the	4	high	Bhavatharani

			characteristics officially			
Sprint-1	Planning	USN-4	Plan the programming language and feasibility	3	medium	Monisha Devi
Sprint-4		USN-14	Demonstrate the working and improve accuracy overall	2	low	Devi

### Project Tracker, Velocity & Burndown Chart:

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	5 Days	20 Oct 2022	24 Oct 2022	20	21 Oct 2022
Sprint-2	20	5 Days	25 Oct 2022	29 Oct 2022	20	27 Oct 2022
Sprint-3	20	5 Days	31 Oct 2022	4 Nov 2022	20	2 Nov 2022
Sprint-4	20	7 Days	5 Nov 2022	11 Nov 2022	20	8 Nov 2022

### Velocity:

We have a 23-day sprint duration, and the velocity of the team is 20 (points per sprint).

To Find: Calculate the team's average velocity (AV) per iteration unit (story points per day)

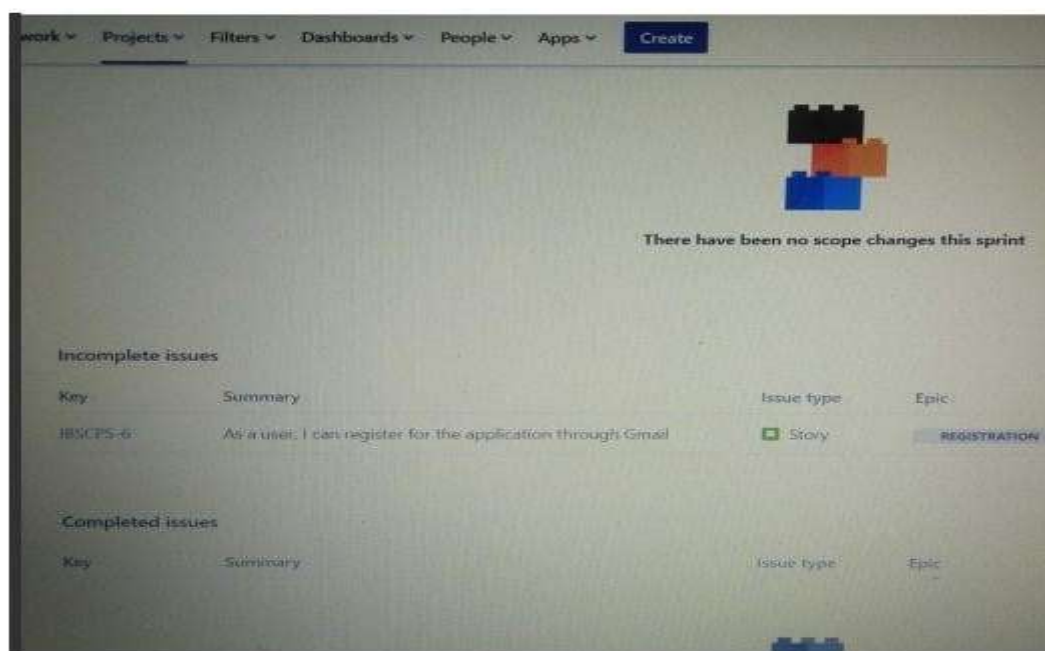

$$1.15 \frac{23}{20} AV = \frac{\text{sprint duration}}{\text{velocity}} = \frac{20}{10} = 2$$

### Burndown Chart:

A burndown chart is a graphical representation of work left to do versus time. It is often used in agile software development methodologies such as Scrum. However, burn down charts can be applied to any project containing measurable progress over time

### 6.3 REPORTS FROM JIRA:

## CHAPTER 8

### TESTING

#### 8.1 TEST CASES:

Section	Total Cases	Not Tested	Fail	Pass
Temperature and Humidity Sensor	20	0	1	20
Ultrasonic Sensor	10	0	1	10
Soil Moisture	30	0	0	30
Wi-Fi Module	6	0	1	6
Transmission Of Data To IBM Cloud	5	0	2	5

#### 8.2 USER ACCEPTANCE TESTING:

##### 1. Purpose Of Document

The purpose of this document is to briefly explain the test coverage and open issues of the Smart Farmer project at the time of the release to User Acceptance Testing (UAT).

##### 2. Defect Analysis

This report shows the number of resolved or closed bugs at each severity level, and how they were resolved.

## CHAPTER 9

### RESULTS

#### IBM WATSON IOT PLATFORM:

The screenshot shows the IBM Watson IoT Platform interface. The top navigation bar includes the IBM logo, the text "IBM Watson IoT Platform", and a user profile icon. The main content area displays a table of events, which is a live stream of data from a device. The table has four columns: Event, Value, Format, and Last Received. The events listed are:

Event	Value	Format	Last Received
Water sensor	["Water Level":17.55]	json	a few seconds ago
Moisture sen...	["Moisture Level":50.66]	json	a few seconds ago
Flame sensor	["Flame":"Not Detected"]	json	a few seconds ago
camera	["Animal attack":"Not Detected"]	json	a few seconds ago
PH sensor	["PH Level":12.175]	json	a few seconds ago

At the bottom of the dashboard, there is a status bar that says "1 Simulation running".

## CHAPTER 10

### ADVANTAGES & DISADVANTAGES

#### **Advantage:**

This proposed work successfully designs a working prototype of an integrated IoT hardware with an platforms like Twilio that fulfils the following functions of timer-based irrigation control, real-time monitoring of farm data and prediction of the weather condition of the crops.

It also integrated with the function of warning the activity of animals and birds in the fields to the users. The real-time data from the farm such as soil moisture are collected from the environment using the sensors that is interfaced respectively.

Another novel feature added in this model is weather API that notifies the weather condition when it goes beyond the expected weather condition. It also comes up with the usage of Twilio ,a platform which is provides programmable communication tools for making and receiving phone calls ,sending and receiving messages and performing other communication functions using its web service APIs.

Here a message is sent to the user when animal is found in the crop field. This proposed prototype system uses the Open Weather map API which provides the real time weather condition for any geographical location.

This system uses the Google Sheets which acts as a Database system that collects the sensor data and store it for future reference to the users.

### **Disadvantage:**

The use of technology in farming and agriculture making it smart agriculture, is of course, a good initiative and a much-needed one with the present increasing demand in the food supply.

But there is the chance where this proposed smart farming protection system will require certain skill sets in particular in order to understand and operate the equipment. In the case of equipment computer-based intelligence for running the devices, it is highly unlikely that a normal farmer will be able to possess this knowledge or even develop them.

Farmers are not used to these high-end technologies. They do not understand computer language or the artificial intelligence. For the smart agriculture, Internet of Things is essential which will require artificial intelligence and computer-based intelligence.

This cannot be balanced here. To overcome this challenge, the devices will have to be changed in a dramatic fashion so as to make it understandable for farmers.

This also means that the devices should be somewhere in between where the technology experts and farmers can both communicate about it.

And also this system needs availability of internet continuously. Rural part of most of the developing countries do not fulfil this requirement. Moreover internet connection is slower.

## **CHAPTER 11**

### **CONCLUSION**

Smart farming is a modern farming management concept with IoT technology to increase the productivity in agriculture.

With the use of smart farming, users can effectively monitor the crop field the quality and quantity of their crops.

Users cannot be physically present on the field 24 hours a day. In addition, the farmers may not have the knowledge to use different tools to measure the ideal environmental conditions for their crops.

IoT provides them with the automated system, which can function without any human supervision and can notify them to make proper decision to deal with different kind of problems they may face during farming.

It has the capability to reach and notify the farmer even if farmer is not on the field, which can allow farmer to manage more farmland, thus improving their production.

Thus, we can conclude that this IoT based smart crop protection system will definitely help users in farmland to effectively monitor their crops with the user-friendly platforms and other alert means.

## **CHAPTER 12**

### **FUTURE SCOPE**

The proposed work system is a successful working prototype that fulfils to protect crops from the intrusion of animals and birds.

This system will help the users to monitor the temperature and to notify the weather conditions.

This system assuredly assists the users to know about the soil moisture level. And the IoT based smart crop protection system implemented here brings a novel approach crop protection system from animals.

This assures the early detection and prevention of incurring losses due to the damage of crops.

The following suggestions may be carried out in future implementation of the system; the smart crop prediction may be also carried out by considering the various factors like NPK content of the soil, UV radiation along with the tracking of the crop field location using GPS module system. The automated pest traps also be introduced using image recognition techniques and neural networks in smart protection system
